About me

Computer Systems Engineer dedicated to the development of contemporary, scalable, and efficient web applications. Possessing full-stack expertise in both frontend and backend development, I enhance development processes through the utilization of modern tools. I am proficient in analytical thinking, problem-solving, and fostering effective collaboration to produce reliable, high-impact software.

Education

B.S **Technological Institute of Jiquilpan**, Computer Systems Engineering — Jiquilpan, Michoacán — Aug 2019 – Aug 2024

- Project: Wizengine: Development of tools and libraries for the continuous improvement of Wizeline processes using technologies such as React, TypeScript, Go, Tailwind CSS, MUI, and PostgreSQL.
- Career concluded with degree and professional licensure.

Experience

iNBest, Full Stack Developer | AI Developer — Guadalajara, Jalisco — Nov 2025 – present — 10 months

• I create comprehensive solutions centered on artificial intelligence, integrating technologies such as TypeScript, React, Next.js, Node.js, and Express with agent-based architectures. My expertise lies in the sophisticated application of Claude Code as a fundamental development framework, incorporating MCP Servers for contextual integration with external tools, data, and services, while also designing Agent Skills and Agent Teams to facilitate automated, collaborative, and scalable workflows. During this role, I developed two full-stack platforms for different clients.

- **Financial Automation Platform (Fintech/SaaS):** I built an internal system for financial operators that automated transaction management, payment reconciliation, and commission calculations through a real-time dashboard with full audit traceability. On the frontend, I developed the operator dashboard in Next.js 14 with role-based protected views, interactive data tables, and real-time updates via WebSocket (Socket.io), along with a custom TypeScript hook library for reconciliation, Excel export, image paste, and OneDrive file management. On the backend, I designed a REST API in Express.js and TypeScript across 13 domain modules, integrating dual enterprise authentication (Microsoft Graph/MSAL and AWS Cognito), AWS S3 storage with presigned URLs, and a MySQL database modeled with Sequelize ORM across 8 interconnected models, all deployed through a CI/CD pipeline in GitHub Actions with Docker and prepared for serverless deployment on AWS Lambda.
- **Automotive Brand Web Ecosystem (Marketing/E-commerce/CMS):** I built a three-layer platform for an automotive brand, including a high-traffic, conversion-focused website with 60+ server-rendered pages in Next.js 13 (hybrid SSR/SSG), product animations with GSAP and Lottie, a vehicle comparison tool, and a Google Maps-powered dealer locator. I also configured and extended a headless CMS (PayloadCMS on Node.js and MongoDB) with 10+ custom collections, 28 custom field types, and 25 composable blocks for no-code page building, plus a custom endpoint for automatic catalog synchronization from an external CRM, and integrations with AWS API Gateway, a vehicle financing platform, and Google Analytics for conversion tracking.

iNBest, Front-End Developer — Guadalajara, Jalisco
Sept 2025 – Nov 2025
3 months

- I engage in the development and implementation of contemporary, responsive user interfaces utilizing TypeScript, React, Next.js, Tailwind CSS, and Material UI, thereby enhancing the user experience. I collaborate on API integration to link services and facilitate real-time data using Node.js, Express, and REST APIs. I possess experience with artificial intelligence tools such as ChatGPT, Copilot, Cursor, and Codex to streamline workflows and enhance development efficiency. Furthermore, I have foundational knowledge of AWS Cloud for the deployment and management of web applications.

Wizeline S. de R.L. de C.V., Intern — Guadalajara, Jalisco
Feb 2024 – Aug 2024
7 months

- I contributed to the development and optimization of an internal employee skills management system at Wizeline, enhancing the user experience through responsive components and more intuitive workflows, which resulted in a navigation and data entry efficiency increase of over 60%. I utilized React, Remix, TypeScript, Tailwind CSS, Material UI, and PostgreSQL to ensure a stable, scalable product with consistent performance. I implemented unit tests with Vitest, thereby enhancing code reliability and minimizing errors in subsequent development stages. Furthermore, I created a text-to-speech conversion module utilizing the OpenAI API, integrating Firebase for secure and scalable storage. The project encompassed the construction of a REST backend using Node.js and Express, along with an interactive frontend based on React.

Projects

Api Explorer — remote
Aug 2026

Four independent backend services, each built with a different architecture pattern, unified under a single API client.

- Implemented four backends in two languages — python-fastapi-tasks (layered/N-tier), python-flask-hexagonal (hexagonal/ports-adapters), node-express-clean (clean architecture), node-fastify-cqrs (CQRS + event-driven) — with JWT auth and SQLite persistence.
- Built a React/Vite API Explorer client (repo) that documents and exercises all four services' endpoints from one interface, replacing manual Postman collections.

Casta Fina — remote
Aug 2026

One-page brand site for a limited-run streetwear cap label, built with Next.js 16, TypeScript, and Framer Motion.

- Built a scroll-driven interactive hero and a certificate-of-authenticity-style bento grid with cursor-tracking border glow effects.
- Delivered a fully responsive single-page experience with smooth-scroll navigation, an auto-advancing testimonial carousel, and WhatsApp-integrated waitlist capture.

FinanceFlow — remote
July 2026

Personal finance web app with 100% client-side persistence — no backend, database, or authentication required.

- Architected a backend-free finance tracker on IndexedDB (Dexie.js) with reactive live queries, removing the need for a global state library (Redux/Zustand)
- Built a client-side PDF report generator (jsPDF) that hand-draws statement-style charts and paginated tables, plus CSV export, entirely in the browser

Ledgerly remote

Aug 2026

Institutional Loan Origination & Servicing System (LOS/LMS) simulating a Mexican SOFOM lending to SMEs, covering the full credit lifecycle with real double-entry accounting.

- Designed a real double-entry ledger on Postgres/Supabase that auto-generates journal entries on loan disbursement and produces 16 PDF reports across finance, portfolio, and risk.
- Built end-to-end credit origination (scoring, AML/PLD sanctions screening, credit committee workflow, disbursement) with Row Level Security and real-time portfolio alerts.

Claude Agent Stack remote

Aug 2026

A full multi-agent development stack for Claude Code — an orchestrator delegating to specialized subagents, a custom persistent memory server, and a live dashboard visualizing agent activity in real time.

- Designed a Claude Code orchestrator that decomposes tasks and delegates to four least-privilege subagents (researcher, coder, docs-writer, memory-keeper), each scoped to its own tool permissions.
- Built memory-engram, a custom MCP server (Node.js/TypeScript + SQLite) with local deterministic embeddings, automatic deduplication, and remember/recall/forget/stats tools — no third-party dependency or API cost.
- Built obsidian-bridge, an MCP server exposing an Obsidian vault as agent-writable memory, with YAML frontmatter validation, path-traversal protection, and wikilink/backlink resolution.
- Shipped a live dashboard (Express + WebSocket backend, React/Vite/D3 frontend) streaming agent status, memory, vault graph, and activity analytics in real time, driven by Claude Code's SubagentStart/SubagentStop hooks; validated end-to-end with automated smoke tests covering REST, WebSocket, and filesystem reads.

Flight Booking Engine remote

Aug 2026

A demo flight booking engine (search → seat inventory → pricing → booking → cancellation) built to showcase two AI-coding tools working alongside Claude Code: a code knowledge graph and a persistent memory system, plus a full-stack React dashboard talking to a real Express backend.

- Built a complete booking engine in plain Node.js (src/) covering flight search with 1-stop itinerary construction, seat inventory management, fare calculation with tax/layover surcharges, coupon-based discounts, and PNR-based reservation/cancellation — all covered by a dependency-free test suite (8 tests).
- Fixed and documented a real inventory bug where cancelling a multi-leg itinerary only released seats on the first segment instead of all segments.
- Built an Express API (server/app.js) as a thin layer over the real booking engine modules — no business logic duplicated between the CLI, tests, and the live API.
- Shipped a React + Vite + Material UI dashboard (web-react/) that talks live to the Express backend, so booking a flight actually consumes real seat inventory on the server in real time.
- Integrated Graphify to generate a queryable knowledge graph of the codebase and Engram for persistent AI-agent memory, capturing real (non-mocked) output from both tools against this exact codebase.

Project Notes Graph remote
Aug 2026

A self-updating graph of your own project portfolio — a scanner reads every project's manifest and git history to auto-generate notes, Graphify turns them into an interactive graph connecting projects by shared technology, and Engram tracks the real design decisions behind how the detection itself works.

- Built a scanner (scanner/scan.js) that walks a target folder, detects each project via package.json / requirements.txt / pyproject.toml / go.mod / Cargo.toml / .git, and infers status (active/paused/done) from last-commit age — including monorepo and multi-repo-container edge cases.
- Mapped detected dependencies to normalized tech nodes (scanner/tech-map.js) covering the JS, Python, Go, and Rust ecosystems, generating a stub note for anything uncurated so rescans never overwrite hand-edited content.
- Shipped an interactive graph + stats dashboard (Express API + React/Vite frontend with vis-network and Recharts) showing project-to-technology relationships and a live donut chart of your real stack usage across your portfolio.
- Used Engram to persist real meta-decisions about how the notes system itself is organized (e.g. "never delete a note the scanner didn't just write"), surfaced in-app via a memory drawer.

Certifications

- AWS Certified Cloud Practitioner (2025)

Skills

Languages & Core Technologies: TypeScript, JavaScript, Python, SQL, Node.js, React, Next.js, Remix, Express, Fastify, FastAPI, Flask, Tailwind CSS, Material UI, REST APIs, Vite

AI Development & Automation: LLM integration, AI-assisted development, Claude Code, OpenCode, MCP Servers, Agent Skills, Agent Teams, OpenAI API, workflow automation, contextual AI systems, prompt engineering, AI debugging and refactoring

Frontend Engineering: Responsive web applications, reusable component architecture, Framer Motion animations, form validation with React Hook Form and Zod, data visualization with Recharts, client-side PDF generation with jsPDF, PWAs, state management with Hooks and Context API, performance optimization, accessibility-first interfaces, real-time UI integrations

Backend & System Architecture: Scalable backend services with Node.js and Python, JWT authentication, SQLAlchemy, RESTful API development, CQRS and event-driven architecture, hexagonal and clean architecture patterns, business logic automation, process orchestration, modular architecture, decoupled systems design

Databases & Backend-as-a-Service: PostgreSQL, SQLite, Supabase (Auth, Storage, Realtime, Row Level Security), IndexedDB (Dexie.js) for client-side persistence

Cloud, DevOps & Infrastructure: AWS, GCP, Docker, Kubernetes, CI/CD pipelines, GitHub Actions, Git workflows, cloud deployment, distributed application management, scalable infrastructure

Testing & Quality Assurance: Vitest, Cypress, automated testing, end-to-end testing, integration testing, software quality assurance, maintainable and reliable code practices

Research Areas: AI-native applications, multi-agent systems, developer productivity with AI, workflow orchestration, intelligent automation, scalable full-stack architectures, human-AI collaboration systems
